Abstract (en)  
[origin: EP2025835A1] The shutter (1) has two movable panels (3) articulated with respect to each other along an axis (P) perpendicular to an unrolling direction (D) of the shutter. Each of the panels includes an additional covering part (6) at panel's lateral end to be laterally deployed with respect to the panel by a translational unit. The part moves between a position at which the covering part is positioned on the panel and another position at which the additional covering part is laterally deployed with respect to the panel. A cap (15) placed at each of lateral ends of the panels includes a fixation unit.
