Abstract (en)  
[origin: EP2026366A2] A rotary selector forming a control element comprises a rotatably mounted control portion (16) and an adapter (18) having a latching section with side faces formed and arranged in a circumferential direction. A stationary spring element (22) is disposed with the latching section of the adapter, and has elastic legs formed and arranged uniformly in the circumferential direction of the latching section and extending relative to the side faces. A rotary selector forming a control element comprises a rotatably mounted control portion (16) and an adapter (18) rotationally fixed to the control portion and disposed to assume rotary positions to be detected and transmitted to the electronic control system. The adapter has a latching section with side faces formed and arranged in a circumferential direction. A stationary spring element (22) is disposed with the latching section of the adapter, and has elastic legs formed and arranged uniformly in the circumferential direction of the latching section and extending tangentially relative to the side faces of the latching section. The side faces of the latching section are an integral multiple of the elastic legs of the spring element.
