Abstract (en)
[origin: WO2007144534A1] The invention concerns a device for suspending items, in particular, a pair of gloves, shoes, or other worn items, or a cap, on the shaft of a presentation stand. The device provides a form of clip with two jointed branches pivoting around a return element which separates two actuating arms in the upper part from two grips in the lower part. One of the actuating arms comprises a curved extension serving as a suspension hook. The device comprises a through-hole through which a fastening link, for either the item clutched between the two grips or an information card like a product ad, can pass. Thus, the item can be easily and efficiently suspended on the shaft of the presentation stand. The pivoting of the two jointed branches guarantees that items of any size can be hanged thereon. Trying on items is made possible by the fact that the fastening link passes through only one of the grips.
