Abstract (en)  
[origin: US8398531B2] An apparatus for overall bodily mobilization of a human subject may include a frame for resting fixed on the ground, a platform for supporting the subject that can be moved relative to the frame, and motorized operating means for operating the platform relative to the frame. The operating means may be configured to both (1) throw the platform offcenter relative to a fixed axis substantially vertical and (2) rotate the platform about the fixed axis when the platform is offcenter. The platform may be provided with movable peripheral bearing means on corresponding supporting means that are secured to the frame. The bearing means may enable the platform to rest on the frame while tilting it in an adjustable manner relative to the horizontal in a plane passing through the fixed axis and a central zone of the platform when the operating means throw the platform offcenter relative to this axis.
