Abstract (en)

[origin: WO2007141001A1] Said cap is constituted of two half-casings, one upper (1) and one lower (2), so that the lower half-casing (2) fixes to the mouth of the container by the inner peripheral skirt (3), and contains a seal in the shape of an inclined plane (4), joined by a rib (5), that allows the seal (4) to partially open, wherein in the upper part of the seal, a vertical stub (5a) is incorporated, which emerges from the inclined plane (4) and enables the seal (4) to return to its original position. The principal advantage of this invention is a notable saving of the product due to the control of consumption, acting as a proportional dispenser of the product according to every need and enabling the seal to be broken via simple rotation, avoiding the use of additional, separate and contaminating items.
