Abstract (en)

[origin: WO2007140871A1] The invention relates to a method for operating a workstation (2) of a textile machine (1) which produces crosswound bobbins and is equipped with a winding apparatus (4) for winding a winding-on bobbin (5) and with a suction nozzle (24) which can be driven by an individual motor for receiving a thread end which is wound onto the surface (35) of the crosswound bobbin (5). There is provision according to the invention for the suction nozzle (24), starting from a position of the suction nozzle (24) which is detected by a sensor, to be positioned in a thread-end receiving position (I) by the execution of a respectively predefined step number of a stepping motor (15), in which thread-end receiving position (I) the opening (34) of the suction nozzle (24) is at a defined spacing (a) from the surface (35) of the crosswound bobbin (5).
