Abstract (en)

[origin: WO2007135321A1] The invention relates to a process for routing data packets (P) between a source node (S) and a target node (C) in an ad-hoc network comprising a plurality of mobile nodes (1-14) that may be located and which move in the circulation channels (L1, L2, L3, C1, C2) of a determined geographical network (10) forming between them a plurality of intersections (I1- 16). This process comprises a selection step for a destination intersection, in which a carrier node (S) of the packets (P) selects, from the neighbouring intersections and according to the traffic conditions, a destination intersection (12); a search step for at least one mobile node (1) next to the packet carrier node and closer to the destination intersection selected (12) than the carrier node; and if at least one neighbouring mobile node (1) is found, a transfer step for the packets (P) of the packet carrier node (S) to the neighbouring node found (1), so as to take the data packets to the destination intersection selected.
