Abstract (en)

[origin: EP2030859A1] The device has adjustment units adjusting inclination of a support (15) relative to a shoe (20) in a lateral direction (D2) after clamping the shoe relative to the support, where the direction is oriented parallel to rotation axes of sheaves. The units have a spacer (36), with a fixed height, inserted between a zone of a top surface of the shoe and a bottom surface (17) of the support. A spacer (37) having a variable height of the units is inserted between the bottom surface and another zone of the top surface, where the latter zone is displaced relative to the former zone in the direction.
