Abstract (en)

[origin: WO2007148006A1] The invention relates to a remote control for electronic apparatus, in particular for performing a physical exercise, so as to monitor an operation parameter of the apparatus through a control signal received by a receiver associated with the apparatus. The device comprises a control signal emitter, control means connected to the emitter so as to transmit to the receiver the control signal corresponding to a value of the operation parameter, an at least partially flexible support with a portion for inserting a support part of the hand. The control means are integrated with the support along the insertion portion and the emitter is integrated with the support at a level of this insertion portion, so that these control means are disposed along the support part of the hand and can be actuated by another part of the hand termed the actuator part.
