Abstract (en)
[origin: US2009023104A1] A lighter for heating-up a smokeless cigarette comprises a housing having a fuel reservoir connected with a burner nozzle via a valve. An igniting device is disposed near the burner nozzle. The valve is openable by an actuator provided on the housing, whereby a flame is ignited by the igniting device. A receptacle is disposed adjacent to the burner nozzle and the igniting device, is accessible through a hole in the housing and is formed in the interior of the housing. The end of a cigarette body facing away from a mouthpiece is inserted into the receptacle so that the corresponding end of a heating pipe, which faces towards the burner nozzle, is heated by the flame in order to vaporize a stimulant in the cigarette. The cigarette can be removed from the receptacle after the stimulant begins to vaporize.
