Abstract (en)
[origin: WO2007147791A1] The subject of the present invention is an electric control or control-by-wire device comprising a control lever (11) that can be moved in a pivoting movement in a plane perpendicular to the lever in a position of rest, and that can be moved in a translational movement in a direction parallel to the lever in a position of rest, a rotary control member (13) that can be moved in a rotational movement and in a pivoting movement in a plane perpendicular to the lever in a position of rest, and an electrical circuit (15) for converting the various movements of the lever (11) and the rotary member (13) into control signals. The device comprises a lever base (19) that can move over a predefined travel parallel to the lever in a position of rest and which keeps the control lever fixed in terms of rotation and comprises a universal joint connection supporting the rotary control member in such a way as to connect it pivotally to the control lever (11).
