Abstract (en)

[origin: EP2033545A2] The method involves emerging air from an interior space (8) of a cabinet (1) as an air stream (11). The air stream is conducted above a heat exchanger surface of a Peltier element (14), and into an air treating unit (16) which is made of temperature regulating material such as phase change material e.g. paraffin. The air from the inner space of the cabinet is cooled by the air treating unit, and is guided into the inner space of the cabinet. Humidity of the air stream is regulated by a unit which is made of humidity regulating material e.g. silicate-gel.
