Abstract (en)
[origin: EP2033558A2] The cleaner (1) has an upper body (3) with a dust collector, and a base unit (2) moved on a surface to be cleaned by a chassis. A motor blower is arranged in the base unit and produces negative pressure on the surface. The upper body and the base unit are pivoted with respect to each other around an axis that is horizontal in a using condition. A rigid fork-type canal component circulates a part of air from the base unit to the upper body and ensures tiltable storage of the upper body with respect to the base unit.
