Abstract (en)

An installation structure for an earth retaining wall is disclosed, in which the upper and lower ends of a corrugated and inclined earth plate (2) are bent in a direction of a plane part of an intermediate side, and an earth plate (2) stacked up and down is prevented from widening by installing a widening prevention member which prevents a widening of up and down inward bent parts contacting with an earth plate which is stacked and inserted between H-beam (1) wing parts at a front end of an earth plate fixture (3) which is threaded and installed between an inner surface of a H-beam wing part and a back surface of the earth plate and allows the earth plate to come closer to the wing part. In addition, a channel shaped bracket (21) capable of slide-inserting the earth plate (2) into the H-beam (1) wing parts at a plane part of both ends of the earth plate for thereby inserting the earth plate between the H-beams (1). Even when a narrow earth plate is inserted between the wider wing parts of the H-beam, the earth plate is stably installed in place. A wire rope (7) is installed at a plurality of H-beams (1) for thereby preventing the neighboring H-beams (1) from being widened.
