Abstract (en)

[origin: EP2034104A2] The device (3) has a weir (7) that is arranged around a discharge opening (6) for maintaining the water level up to a minimum height (H). A top wall (8) is positioned at a distance from the discharge opening to prevent the discharge of air into the vortex formed in the discharge opening. The weir is provided with specific shaped cross-section along the water flow direction, while width along the base of weir is larger than the maximum height of weir.
