Abstract (en)
[origin: EP2034122A1] The device (6) has a flange (7) comprising an anchoring member (7a) in a part of a case of a rolling shutter. A lug (8) has anchoring members (8a) in the part and blocking members of the flange relative to the part along a longitudinal direction (H). The lug is placed on the part by a sliding movement along the direction from a reverse position to a forward position. The flange and the lug include reciprocal assembling members e.g. opening (12), and an excrescence such that the flange and the lug constitute an assembly formed, stored, provided and placed on the part of the case. An independent claim is also included for a method for mounting a case of a rolling shutter.
