Abstract (en)
[origin: WO2008004938A1] Bridle or the like which comprises a crownpiece (2), two cheekpieces (8, 10), and a browband (1). The browband (1) and crownpiece (2) form an encircling crown (3), and the cheekpieces (8, 10) are connected to the crown so that an imagined extension of the longitudinal axis of each cheekpiece in the direction towards the crown crosses an encircling centre line on the crown in a transitional part between the browband (1) and the crownpiece (2) in such a direction that the tangent of the centre line in each crossing point in a direction towards the crownpiece forms an acute angle α with the extension and that the tangent of the centre line in each crossing point in the direction towards the browband (1) forms an obtuse angle β . Traction forces from the bit will be taken up by the crownpiece (2) of the crown (3). The crown forms a continuous encircling track with an upper (4) and a lower (5) limiting edge. The lower limiting edge (5) has a circumference that is greater than the circumference of the upper limiting edge (4).
