Abstract (en)
[origin: FR2903434A1] The device has a transversal retaining pin (9) removably fixed in a hole (10) of a bridging element (2) transversal to a housing (8) of an articulation axle (7) to axially retain the axle in the housing against return force of a helicoidal compression spring. The helicoidal compression spring is prestressed in the housing between a bottom (8a) of the housing and an end of the axle. An independent claim is also included for a method of installing a bridging element.
