Abstract (en)

[origin: US2008005806A1] An apparatus, network entity, methods and computer program products are provided for selectively enabling one or more features subject to digital rights management (DRM) based upon communication between a mobile station or other end user apparatus and a network entity. By permitting selective enablement, end users need not pay for features that are not employed. However, a manufacturer can incorporate the same plurality of features into each apparatus so as to thereby effectively have a universal model of the apparatus which may be customized by the user with only selected features enabled with the others remaining disabled.
