Abstract (en)

[origin: EP2036726A2] The method involves driving a main drive (19) with a constant rotational speed or with a lead rotational speed in an oscillating manner during a lead operation, after an emergence of a stopper such that a printed sheet is discharged from printing units (10-13) using a transfer cylinder (15) and a counter pressure cylinder (14). An auxiliary drive (20) is driven with a smaller speed such that a plate cylinder (17) and inking units (16) of the printing units are driven with a smaller rotational speed than the transfer and counter pressure cylinders during the discharge of the printed sheet.
