Abstract (en)

[origin: EP2036800A2] The method involves providing a signal-technical safe operation and observation level (1), a safety level (2) and a process level (4) containing elements to be controlled, and providing a data communication device between the elements of the levels. Safety-oriented examinations and algorithms are provided for ensuring a process safety by a safe computer system (3) of the safety level, where the computer system and/or other components of the operation and observation level and the process level are satisfied for smaller safety requirements. An independent claim is also included for a device for signal-technically safe electronic element control for execution of a drive operation of rail vehicles.
