Abstract (en)
[origin: EP1832700A2] A bolt (6) is pushed back into an unlocked position. An initial load pick-up is released on a lock latch (8). Pressure control is used to stop the bolt in the unlocked position. After a fixed interval of time, the bolt is locked again in a locked position. This means that the opening of a door or window does not happen. An independent claim is also included for a locking system for a door.
