Abstract (en)

[origin: EP2037077A1] The slide-bar (1) has jointing units constituted by a support flange for receiving complementary jointing units with a stopping device (3) by moving the flange along a direction perpendicular to a longitudinal axis of the slide-bar and by engaging the flange in a groove. The stopping device provides immobilization of the complementary jointing units in the slide-bar along the moving direction in the slide-bar of a screening device. The support flange is defined in the slide-bar on which the stopping device is supported.
