Abstract (en)
[origin: EP2037176A2] The method involves providing a vaporization burner with a fuel pump for delivery of fuel e.g. kerosene, and a blower for delivery of combustion air. One-third of flame holders facing a vaporization chamber, is filled with air/fuel mixture. Rotational speed (D) of the blower is controlled according to a function, where a changeable correction factor in the function is updated according to given criteria. Either a temperature of the chamber, a temperature of the air/fuel mixture or a temperature of an inner wall of the holders, and an internal reference valve are used to update the factor.
