Abstract (en)
[origin: EP2037483A1] A CFL light source replacing a J-type halogen lamp includes electrodes, a casing, a ballast, a CFL light tube, a connecting member, a socket and pins. A spacing of the electrodes, at two sides of the ballast, follows completely a standard length of a J-type halogen lamp; and a structure of the electrode complies with an R7s or RX7s lamp holder design. The ballast is in the casing, the electrodes are at two ends of the casing and the CFL light tube is connected with the casing that it can be inserted into or pulled out of the casing, forming a CFL energy-saving light source with two energizing ends, which can directly replace a J-type halogen light source in an ordinary lawn lamp. Besides, the casing and the CFL light tube can be designed as an integral unit or two separate units connected through the pins and the socket.
