Abstract (en)

[origin: EP2039281A1] A dishwasher includes a wash tank (T) enclosed inside an external casing (E), as well as a container (C) arranged between the wash tank (T) and the external casing (E) and operatively connected through pipings to the network water feed and the wash tank (T). The container (C), used to store the water to be used in the following wash phase, extends over at least one side of the wash tank (T) but is not in contact therewith so as to capture the heat radiated from the wash tank (T) during the wash phase without directly absorbing heat therefrom by contact.
