Abstract (en)

[origin: EP2039606A1] The installation has indicator units for indicating absence of fixation of a piston head (7) on a pusher element (6) and assigning a shape of a stop (8). The stop is mobile between an active position and an inactive position in which the stop authorizes placement of a filling liquid pocket (10). The stop is placed on a path followed by the pocket during placement of the pocket in a space (4) on a frame (1), and prevents placement of the pocket in the active position. The stop is maintained in the inactive state by the piston head at a fixed state of the head on the element.
