Abstract (en)

[origin: US2009071075A1] A door hinge for a door mounted on a cabinet in such a way that it can pivot open. A displacement mechanism is installed in the hinge to allow the door to be simultaneously lifted from the frame of the cabinet during a pivoting movement of the door into an open position. The displacement mechanism includes a slide displaceably disposed in a hinge housing secured to the cabinet frame and carrying the door via a mounting element mounted in the door, and a runner integrated in the slide and moveable relative thereto, the runner being connected to the mounting element. A glide layer, made of wear-resistant material having a gliding capability, is disposed between those surfaces of the hinge housing and/or of the slide and/or of the runner that respectively slide against one another during displacement of the slide in the hinge housing and of the runner relative to the slide.
