Abstract (en)

[origin: EP2039902A2] The device (3) has components provided with a set of geometries in dependence of the temperature of a cooling agent, where the geometries correspond to a set of meta stable states. One of the meta stable states corresponds to a less flow rate, and the other meta stable state corresponds to a high flow rate. The device passes from a meta stable condition into another meta stable condition during transition of the temperature of the cooling agent from a temperature range into another temperature range.
