Abstract (en)

[origin: WO2008009402A1] Auxiliary drive for a machine that processes plate elements of the type comprising a feed table provided with at least one lower drive belt (11) for conveying a sheet (3) of plate elements. The drive comprises a frame intended to be positioned above the feed table of the processing machine. According to the invention, the frame supports - at least one upper drive belt(15) capable of co-operating with the lower drive belt(s)(11) for conveying said sheet (3) of plate elements by exerting pressure and driving force on the upper surface of the sheet (3), and - a drive mechanism of the upper belt(s)(15), capable of driving the upper drive belt(s)synchronously with the lower drive belt(s)(11). The invention further relates to a processing machine for plate elements of the type comprising a feed table provided with at least one lower drive belt (11) for conveying a sheet (3) of plate elements comprising said auxiliary drive.
