Abstract (en)

The method involves supplying small plant parts i.e. small wooden parts, to a press area (5). The parts are compressed and are shifted in an extrusion direction. The parts are subjected to steam, where steam admission takes place via short-term steam injection. Temporal progression of the injection is aligned such that a binding agent is temporarily heated to a peak temperature, where predominant part of water in the agent evaporates and makes the agent to gel form. Mixing temperature supporting energy entry of injection operation is set in a strand according to the injection. An independent claim is also included for a device for producing a profile material.

Abstract (de)

Die Erfindung betrifft ein Verfahren und eine Vorrichtung zum Strangpressen von pflanzlichen Kleinteilen, insbesondere Holzkleinteilen mit Bindemitteln die in einer Strangpresse zu Strängen gepresst werden wobei das Bindemittel durch Dampf oder Heißwasser auf bis zu etwa 180°C erwärmt wird und in weniger 2 s giert.
