Abstract (en)

[origin: EP2042314A1] The cylinder (1) has three channels (2a, 2b) for fastening a covering, where one of the channels is provided in middle regions (C, D) of the cylinder. The other channels displaced towards the former channel in a circumferential direction are provided in lateral regions (A, B, E, F) of the cylinder, so that the channels overlap in a partial region in an axial direction, where the latter channels are not connected with each other. The latter channels are axially spaced from each other, and the former channel is displaced in the circumferential direction.
