Abstract (en)

[origin: EP2042457A2] The method involves producing a material web strip (6) in a lateral edge region (R) of a material web (2) by a cutter (7) that comprises a cutting unit (8) and arranged in front of a new winding gap (N.1) in a running direction (L) of the web. The strip is cut through by a separation unit (11) by traversing through the gap. The cutting unit is moved transverse to the direction, and the entire web is cut to a width and discharged. The discharged web is transferred to a new winding core (3.1) after attaining a desired quality characteristic e.g. surface roughness. An independent claim is also included for a winding machine for winding a continuous material web.
