Abstract (en)

[origin: EP2042676A2] The method involves connecting panels by hinges, where each panel is formed by a rigid metallic case that is closed from all sides. Each panel has a height identical and corresponding to exact dividend of height of a sectional door and a width corresponding to that of the door based on dimensions of a vertical side of a bay to be closed and irrespective of the height and the width of the door. An insulating material is injected into the case through a hole (11) provided on one of rigid lateral ends (9, 10) of the case.
