Abstract (en)
A loom stores stoppage information including a step number each time the loom stops due to a weaving failure during a weaving operation, and displays an aggregation result on a display device (4) as operational information in response to a display request. The aggregation result is obtained by aggregating the stoppage information stored in a period before the time of issuance of the display request. The number of stoppages of the loom is aggregated for each of the step numbers to obtain aggregation results for the respective step numbers, and the aggregation results are displayed on the display device (4) in association with the respective step numbers.
