Abstract (en)
[origin: EP2045390A1] A clothes airer of the type comprising two tubular support structures (1, 2), each presenting at least one crosspiece (3, 4), from the ends of each of which there extend two uprights (5-8) connected together by parallel rods (9) for suspending the clothes to be dried, and first means (10) and second means (11) for hinging together the free ends (5A-8A) of said uprights to enable variation of the angle (A) formed by the planes (P1) and (P2) in which said structures (1, 2) lie, to hence be able to position the clothes airer in a rest position (R) in which said angle (A) is substantially equal to 0°, and in a plurality of operative positions in which said angle (A) is different from 0°, in which the tubular structures (1, 2) have different mutual dimensions, with said hinging means (10, 11) shaped such that when in its rest position (R) the structure (2) of lesser dimensions is substantially contained within that (1) of greater dimensions, to hence reduce the transverse dimension (T) of the clothes airer to the size of just one (1) of said support structures and of the relative hinging means (10, 11).
