Abstract (en)

[origin: EP2045420A1] The system has a hook pivotably mounted on a support integrated to a door. A cam unit (39) is remotely controllable and locks and unlocks a handle. An actuator (34) e.g. linear motor, is connected to the cam unit by a movement transmission mechanism (36) for remotely controlling the cam device. The cam unit has a cam element (40) rotating between a locking position, in which the element locks the hook in a handle closing position, and an unlocking position, in which the element unlocks the handle to an open position. The element is mounted on the support and rotated by the actuator.
