Abstract (en)

[origin: WO2008009817A1] The subject of the invention is a bicycle frame C comprising at least one fork (10) comprising two branches (12) which are mounted one on each side of a wheel R of rim J, said frame C being equipped with a braking device D such that each branch (12) of said fork (10) incorporates at least one braking element E comprising means (14) of attachment to the frame C, a rigid arm (16) that can move relative to said attachment means (14) and is able to adopt all positions between two extreme positions, namely a rest position and a braking position, a friction member (18) borne by this arm and designed to collaborate with said wheel rim, and a connection (20) with elastic return interposed between the attachment means (14) and the arm (16).
