Abstract (en)
[origin: CA2659438A1] The invention relates to a trigger device for a firearm, in particular a self-loading military rifle, especially an attack rifle, having a trigger piece (11), a sear release part (9) connected to the trigger piece (11) and at least one trigger spring (29) which acts on the sear release part (9). This trigger device is characterized in that the trigger piece (11) is arranged separately from the sear release part (9) between two stops (35, 37), one (35) of which prevents the movement of the trigger piece (11) relative to the sear release part (9) forwards, while the other (37) prevents such movement to the rear, with a short movement of the trigger piece (11) relative to the sear release part (9) being possible between the two stops (35, 37) and a lost-motion spring (33) acting on the trigger piece (11) and being preferably arranged between the trigger piece (11) and the sear release part (9), pushing the trigger piece (11) forwards considerably more weakly than does the trigger spring (29).
