Abstract (en)

[origin: EP2048307A2] The device has a lock arranged in a distance to a closing cylinder. A shaft (20) is connected with an outlet unit (15) of the closing movement of the cylinder at a side and with the lock at another side in a coupling position so that the torque of the cylinder is directly or indirectly received and transferred to the lock. The shaft is held in the outlet unit in a torque-proof and longitudinal-shifting manner. The shaft is movable between an inserted installation position and a stretched coupling position by longitudinal-shifting and arranged outside the lock in the installation position.
