Abstract (en)

[origin: EP2048345A2] The exchanger (1) has flow channels (2, 3) for flowing through with respective fluids. The flow channels are separated from each other by a separator (4) e.g. partition wall and/or partition wall section. A housing element (5) feeds the channels with one fluid. A leakage minimization expansion duct (6) is formed in sections between the separator and the housing element such that a leakage flow of the fluid is reduced between the channels, and longitudinal and/or transverse extensions of the separator and the housing element are held by the duct.
