Abstract (en)
[origin: WO2008017705A2] A texturing machine is described for texturing and reeling a plurality of threads which is composed of two machine halves. The machine halves are placed against one another in a mirror-image manner and have respectively several operating points with several process units for texturing and reeling several threads. Heating devices thereby face one another in a symmetry plane, which heating devices can be controlled and regulated separately from one another in the machine halves. In order to obtain a compact, space-saving construction and also avoid heat losses, the heating devices of the two machine halves are arranged jointly in the symmetry plane in an insulating housing according to the invention, a heat barrier being embodied inside the insulating housing between the heating devices. Individual settings in the heating devices are thus possible without impacting one another.
