Abstract (en)
[origin: WO2008101536A1] The invention relates to a position sensor device (44, 45) for an actuator (7) having a guide housing (11) for guiding a movable actuator element (8) and having a sensor (54) for generating a position signal (90) which indicates a position of the actuator element (8) or of an outer object (9), in particular a slide (12), which is movement-coupled to the actuator element (8), when the actuator element (8) or the object (9) is situated in a detection region (53) of the sensor (54). The position sensor device (44, 45) has a first and at least one second optical display means (161, 162) for displaying the position signal (90) which the sensor (54) generates. The two display means (161, 162) are spaced apart from one another in such a way that at least one of the display means (161, 162) can be seen if the other is covered by the actuator element (8) or the object (9) which is movement-coupled to the actuator element (8).
