Abstract (en)

[origin: WO2008010086A2] A loudspeaker system includes at least two stand-alone multiple loudspeaker devices (1L, 1R), each comprising a frame (3) with a horizontally oriented array (5) of first loudspeakers (7) for reproducing sound in a higher frequency range. The system further includes a second loudspeaker (11) for reproducing sound in a lower frequency range, the frequency ranges having a crossover frequency f_{c} . The first loudspeakers each have a first radiation surface (9) of maximal 1000 mm and the second loudspeaker has a second radiation surface (13). In each device (1L, 1R) a central area (9a) of each first radiation surface being situated at a vertical distance d , from a central area (13a) of the second radiation surface wherein $750 \text{ Hz} = f_{\text{c}} = 3000 \text{ Hz}$ and $d = 2.5 f_{\text{c}}$, wherein f_{c} is the wavelength of the reproduced sound at the crossover frequency and wherein d is minimal 75 mm and maximal 3000 mm. The system also includes a means for processing an audio content signal to generate individual signals for input to the first loudspeakers resulting, during use of the system, in a directional acoustic signal of the array of first loudspeakers of each device. This system is able to reproduce sound of high fidelity qualification.
