Abstract (en)
[origin: EP2050704A1] An emergency release enables a door lock to be transferred from a locked position into a released position, in which the emergency release has a follower arranged in a housing, which during transfer of the door lock is actuated in its released position by the emergency release key (7). A lock element (12) when closed partly closes the housing opening (11) and prevents insertion of the emergency key (7) for coupling to the follower. A control element (13) transfers into a control position by engaging of the emergency release key (7), to open the lock element (12). An independent claim is given for an additional housing for an emergency release.
