Abstract (en)

[origin: WO2008019737A1] A module (10) for an alternating device for coating materials, in particular for paints, comprises a housing (12) and at least one feed channel (32) which can be fed with coating material from the outside. There are at least two dispensing channels (80a, 80b) which can be connected to an applicator and are connected to the feed channel (32) via a flow path (60a, 72a, 74a, 76a; 60b, 72b, 74b, 76b). The flow paths (60a, 72a, 74a, 76a; 60b, 72b, 74b, 76b) between the feed channel (32) and the respective dispensing channel (80a, 80b) can either be closed or released by means of means (94a, 94b). A first dispensing channel (80a) can be fed with coating material independently of a second dispensing channel (80b). In addition, an alternating device, which is constructed from a plurality of modules, for coating materials is provided, in which an individual module (10) is designed as the module (10) according to one of Claims 1 to 8.
