Abstract (en)  
[origin: WO2008022634A1] A device for repositioning a person from a first position into at least a second position, comprising a base part disposed on the bottom and a rotating part rotatably mounted on the base part, further comprising at least a first retaining part disposed substantially perpendicular in relation to the rotating part for temporarily balancing the person, is characterized by a plurality of radially outwardly protruding support arms projecting beyond the base part and the rotating part and disposed between the base part and the rotating part, wherein roller bodies suitable for displacing the entire device are provided on these support arms, the device being displaceable along these bodies in a rolling manner.
