Abstract (en)

[origin: EP1892112A1] Material comprises a substrate with an ink layer containing a pigment selected from calcium carbonate, calcined clay and/or gloss white and a surface layer containing cationic inorganic particles. The average particle size of the pigment is 0.1-1.5 μ m. The recording material has a luster on the side on which the surface layer is applied. The density of the recording material is at least 0.95 g/cm³. An independent claim is also included for a method for the production of the inkjet recording material. Preferred Features: The substrate is made from paper or cardboard. The pigment is a cationic or anionic pigment. 5-35 wt.% binder is included in the ink layer. A cationic compound is included in the ink layer and/or in the surface layer.
