Abstract (en)

[origin: WO2008019915A1] A device and a method for the actuation of personal protection means is provided, wherein a feature vector, having at least two features of at least one signal of an accident sensor system is formed by an evaluation circuit. The evaluation circuit classifies the feature vector into the respective dimension by means of at least one classification limit. The actuation circuit generates an actuation signal, wherein an actuation circuit actuates the personal protection means as a function of the actuation signal.
