Abstract (en)
[origin: WO2008022871A1] The present invention relates to a device for controlling electric or electronic organs, comprising a pad (3) hinged about an articulation axis (7) for the pivotal movement of the pad (3) between a rest position and an enable position, and location means (43) of a control organ such as a user's finger (12) inside a control surface (44) on the pad (3). The device further includes means (14) for applying a vibratory movement to the pad (3), wherein said means can be activated according to the control organ positions detected by the location means and are provided so as to apply the vibratory movement to the pad (3) via the articulation axis (7, 9) of the pad (3).
